

App Feature List

Pharmacist Dispense-or-Refer Decision App — Ghana

What the app does

A pharmacist ticks the symptoms a patient reports. The app tells them whether it is safe to advise/dispense an over-the-counter medicine, or whether the patient should be referred to a doctor or nurse. Only anonymous symptom data is kept — no patient names or personal details.

Free Tier — Core Decision Engine

Guided Symptom Intake (Symptom Chips)

Pharmacist taps symptoms from a list instead of typing. Fast and consistent.

Dispense-or-Refer Decision Logic

The core engine. Gives one clear answer: safe to dispense, or refer to a doctor/nurse.

Red-Flag Symptom Alerts

Certain dangerous symptom combinations always trigger a refer-out, no exceptions.

Suggested OTC Guidance

For minor cases, suggests a general medicine category to consider (not specific brands).

Offline-First Operation

Works with no internet. Syncs automatically once the device reconnects.

Under-2-Minute Workflow

Minimal taps, no typing. Built to fit into a busy shop counter.

Browser-Based, No Hardware Needed

Runs on any phone, tablet, or laptop the pharmacist already has.

Anonymous Symptom Logging

Only the ticked symptoms and the outcome are saved. No names, no phone numbers.

Premium Tier — Paid Features

Local Symptom Analytics Dashboard

Shows which symptoms are trending in the shop over time. Helps with stocking decisions.

Overuse Pattern Alerts (Shop-Level)

Flags when a shop's painkiller dispensing rate rises above its own normal level.

Drug Interaction & Overdose-Risk Warnings

Warns when a symptom and requested drug combination carries a known health risk.

Customizable Triage Rules

Lets a shop or chain adjust which symptoms trigger a refer-out, based on their own guidance.

Multi-Branch Analytics

For chains: compares symptom trends and decisions across multiple branches.

Compliance Reporting Export

Generates anonymous activity reports to show regulators, like the Pharmaceutical Society.

Seasonal/Regional Health Trend Reports

Combines anonymous data across shops to reveal wider disease trends, like malaria season.

Staff Training Mode

A practice mode with sample cases to train new staff before they use the app live.

Positioning note: the app supports a pharmacist's dispense-or-refer decision. It does not diagnose patients and does not store any personally identifying patient data.
